FAN7387
Self-Oscillated, High-Voltage Gate Driver

Features
- Internal Clock Using RCT
- External Sync Function Using RCT
- Dead Time Control Using Resistor
- Shut Down (Disable Mode)
- Internal Shunt Regulator
- UVLO Function, High and Low Side

Applications
- Half-Bridge Inverter
- SMPS
- Ballast Solution for High-Intensity Discharge (HID) Lamp
- Ballast for Fluorescent Lamp

Description
The FAN7387 is a simple control IC for common half-bridge inverters, SMPS, and ballast for fluorescent and HID lamps. The FAN7387 has an oscillating circuit using an external resistor and capacitor.

The frequency variation is very stable across a wide temperature range. The FAN7387 has an external pin for dead-time control and shutdown. Using this resistor, the designer can choose the optimum dead time to reduce power loss on switching devices, such as transistors and MOSFETs.

### Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. $T_A=25^\circ\text{C}$ unless otherwise specified.

**Note:**
2. Do not supply a low-impedance voltage source to the internal clamping Zener diode between the GND and the VDD pin of this device.

### Recommended Operating Ratings

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Functional Description

1. Under-Voltage Lockout (UVLO) Function

FAN7387 has a UVLO circuit for a low-side and high-side block. When \( V_{DD} \) reaches to the \( V_{DDUV+} \), the UVLO circuit is released and the FAN7387 operates normally. At UVLO condition, the FAN7387 has a low supply current of less than 130 \( \mu \)A. Once UVLO is released, FAN7387 operates normally until \( V_{DD} \) goes below \( V_{DDUV-} \), the UVLO hysteresis.

FAN7387 also has a high-side gate driver. The supply for the high-side driver is applied between \( V_B \) and \( V_S \). To prevent malfunction at low supply voltage between \( V_B \) and \( V_S \), FAN7387 provides an additional UVLO circuit. If \( V_B-V_S \) is under \( V_{BSUV+} \), the driver holds LOW state to turn off the high-side switch. Once the voltage of \( V_B-V_S \) is higher than \( V_{BSUVH} \), after \( V_B-V_S \) exceeds \( V_{BSUV-} \), the operation of driver resumes.

2. Oscillator

The running frequency is determined by an external timing resistor (\( R_T \)) and timing capacitor (\( C_T \)). The charge time of capacitor \( C_T \) from 1/4 \( V_{DD} \) to \( V_{DD} \) determines the running frequency of LO and HO gate driver output. Figure 30 shows connection configuration.

![Figure 30. Typical Connection Method](image)

Figure 30 shows the typical waveforms of RCT, LO, and HO. From the circuit analysis, the discharging time of RCT, \( t \), is given by Equation 1:

\[
V_{RCT} = V_{DD} \times \ln\left(-\frac{t}{R_T \times C_T}\right)
\]  

Equation 1 enables calculation of discharging time, \( t \), from \( V_{DD} \) to 1/4 \( V_{DD} \) by substituting \( V_{RCT} \) with 1/4 \( V_{DD} \).

\[
t = 1.38 \times R_T \times C_T
\]  

The running frequency of IC is determined by 1/T and is approximately given as:

\[
f_{running} = \frac{1}{T} = \frac{1}{2(t + T_{fix})}
\]  

where, \( t \) is the discharging time of the RCT voltage and \( T_{fix} \) is constant value about 450 ns of IC.

3. Programming Dead-Time Control / Shutdown

A multi-function pin controls dead-time using an external resistor (\( R_{DT} \)) and protects abnormal condition using an external switch. This pin should be connected to an external capacitor to maintain stable operation.

If the voltage of DT/SD is decreased under 1 V by an external switch, such as the TR or MOSFET, the FAN7387 enters shutdown mode. In this mode, the FAN7387 doesn’t have any output signal.

![Figure 32. External Shutdown Circuit](image)

Figure 32. External Shutdown Circuit

![Figure 33. Adjustable Dead Time](image)

Figure 33. Adjustable Dead Time

4. Gate Driver Operation

The FAN7387 has a two operating modes. One is the self-oscillation mode by using external timing resistor (\( R_T \)) and external timing capacitor (\( C_T \)) and the other is the forced oscillation mode by external PWM signal comes from U-com and the other devices.

Figure 33 shows operation of the IC using an external PWM circuit with additional resistors (\( R_1 \) and \( R_2 \)) for internal limitation of the IC. The input signal range from an external circuit must be within 3/5 \( V_{DD} \) and 3/4 \( V_{DD} \). The external signal produces the HO and LO output and HO signal is in-phase with the external input signal.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HERIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVER THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component in any component of a life support device or system whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation’s Anti-Counterfeiting Policy. Fairchild’s Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substantial performance, safety failures, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild’s quality standards for handling and storage and provide access to Fairchild’s full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise.

For more information please visit Fairchild’s Anti-Counterfeiting web page on www.fairchildsemi.com.
